EU Survey on Income and Living Conditions (EU-SILC) 2005

	EU-SILC 2004	EU-SILC 2005	% Change
Percentage of persons			
at risk of poverty (60% threshold)	19.4	18.5	-
in consistent poverty	6.8	7.0	-
Average income per week			
gross household income (per household)	€945.20	€978.88	3.6
disposable household income (per household)	€740.35	€776.10	4.8
equivalised disposable income (per individual)	€359.78	€378.84	5.3
Poverty threshold			
60% of median equivalised income (per individual)	€185.51	€192.74	3.9

Substantial drop in risk of poverty rate for elderly

In 2005 just over 20% of those aged 65 and over were at risk of poverty, representing a significant decline on the 27% recorded one year previously. Over the same period the rates for persons under 65 remained relatively unchanged. At an overall level 18.5% of the population were at risk of poverty, compared with 19.4% in 2004. See tables 1, 3 & graph opposite.

The percentage of the population living in households that experienced some element of enforced deprivation, according to the eight basic deprivation indicators used in the survey, increased from 18.3% in 2004 to 19.2% in 2005. Those living in lone parent households had the highest deprivation levels in 2005, as in 2004, with almost 60% reporting deprivation in respect of at least one of the eight deprivation indicators. See table 6a & background notes.

When the risk of poverty is combined with enforced deprivation the results show that the levels of 'consistent poverty' remained relatively unchanged over the period, with rates of 6.8% and 7.0% in 2004 and 2005 respectively. See table 7 & background notes.

The average gross household income in 2005 was just over €51,000 per annum or €978.88 per week, an increase of 3.6% on 2004. The average net disposable income was €776.11 per week, an increase of 4.8%. After adjusting for household size and composition, the average equivalised disposable income across all individuals increased by 5.3% from just under €360 to almost €380 per week. See annex.

For more information contact Kathryn Carty on 021-453 5302 or Caroline Barrett on 021-453 5485.

The at risk of poverty threshold, set at 60% of median equivalised income, was just over $\in 10,000$ per annum or almost $\in 193$ per week in 2005, an increase of 3.9% from 2004. In practice this means that persons living alone with a net disposable income of less than $\in 193$ per week were considered to be at risk of poverty, while the threshold for households consisting of two adults and two children was $\in 447.15$. *See annex*.

Social transfers reduce poverty rate by more than half

If no account was taken of social transfers (such as unemployment benefits, child benefit and pensions) the risk of poverty would have been much higher at around 40% in both 2004 and 2005. The impact of their inclusion was to more than halve the risk in both years through a reduction of almost 22 percentage points in 2005 and 20.4 percentage points in 2004. *See table 3*.

Social transfers play a particularly important role in reducing the risk of poverty for those aged 65 and over. The inclusion of pensions and survivors' benefits reduced their risk of poverty from over 88% to just under 40% in 2005, while the inclusion of other social transfers brought the rate down by a further 20 percentage points to 20.1%. *See table 3 & graph opposite.*

The impact of social transfers on those under the age of 65 was less pronounced. The at risk of poverty rate for children was reduced by 19 percentage points from 40% to 21.2%, while for persons aged 15-64 the rate fell by almost 15 percentage points from 32.3% to 17.4%. *See table 3*.

No significant difference between male and female risk of poverty rates

While females were found to have a higher risk of poverty than males in 2004, there was little or no observable difference in 2005. The rate for females dropped by 2.3 percentage points to 18.5% while the rate for males remained relatively unchanged over the year at 18.4%. The most significant decrease for females was among the elderly, where the poverty risk dropped from 28.2% in 2004 to 19.9% in 2005. *See table 3*.

While the risk of poverty for males remained relatively static over the year there were some changes within the various age groups. The at risk of poverty rate for males aged 65 and over fell from 25.8% in 2004 to 20.3% in 2005. The rate for those aged 15-64 showed a slight increase from 16.4% to 17.0% with a more significant increase evident for those aged under 15 where the risk of poverty increased from 19.5% to 22.1%. *See table 3*.

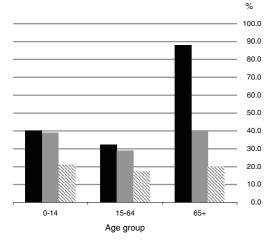

Significant decrease in poverty rates for lone parent households

The at risk of poverty rate for persons living in lone parent households declined from 48.3% in 2004 to 40.7% in 2005. However, they were still a particularly high-risk group. Decreases in the risk of poverty rate were also evident among the '1 adult, no children' households, a grouping predominantly composed of the elderly, where risk of poverty decreased from 35.7% in 2004 to 28.8% in 2005. *See table 4.*

Other high-risk groups were the unemployed and the ill or disabled. Though the at risk of poverty rates for the ill or disabled have decreased consistently over the past 2 years, from 51.7% in 2003 to 40.6% in 2005, the unemployed have only shown a very slight reduction from 41.5% to 40.6%. *See table 4 & graph opposite.*

In 2005, almost 30% of adults who had no more than a primary level education were at risk of poverty. The risk was halved to 14.8% for persons with a higher secondary education, while just under 4% of persons with a third level degree or above were considered to be at risk. *See table 4*.

At-risk-of-poverty-rates (60% threshold) classified by age group, EU SILC 2005

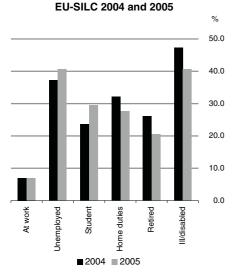

■ Income excluding all social transfers (60% threshold)

■ Income including old-age and survivors' benefits but excluding all other social transfers (60% threshold)

Social transfers (60% threshold)

Percentage of persons at-risk-of-poverty classified by Principal Economic Status,

Non-Irish nationals had a much higher risk of poverty than Irish nationals. In 2005 almost 27% of non-Irish nationals were at risk of poverty, compared with 18% for Irish nationals. *See table 4*.

Debt problems high among households with children

In 2005, one in ten persons were in households that reported 'experiencing debt problems arising from ordinary living expenses'. This has been consistently the most common type of deprivation reported since 2003 and is particularly prevalent among households with children. In 2005, almost 40% of persons in lone parent households reported having debt problems, along with 15.3% of persons in 'other households with children' and 10.2% of households with '2 adults and 1-3 children'. Among households without children, the proportions ranged from 4.5% for 2 adult households to 6.3% for households with 3 or more adults. *See table 5a.*

Almost 7% of persons were in households that reported being 'unable to afford new (rather than second-hand) clothes' and 6.5% went 'without heating at some stage in the past year' due to lack of money. *See table 5a.*

Almost 20% of all persons reported experiencing difficulties in respect of at least one of the eight basic deprivation indicators in 2005. Persons living in lone parent households were most likely to experience more than one form of deprivation with almost 40% reporting difficulties in respect of two or more of the indicators. This compares with less than 5% for persons living in households with '3 or more adults and no children'. In general, deprivation levels were higher among households with children compared to those without children. See table 6a & graph opposite.

Consistent poverty higher among females than males

In 2005, 7.5% of females were in consistent poverty, compared to 6.4% of males. A similar gender differential was evident in 2004, with rates of 7.4% and 6.2% respectively. In terms of age, children aged 0-14 had a much higher consistent poverty rate than persons aged 15-64 (10.2% compared with 6.5%) in 2005, while the consistent poverty rate for the elderly was significantly lower than both at 3.7%. *See table 7.*

Members of lone parent households were again the most significantly at risk group, with over 27% in consistent poverty. Over 21% of persons living in rented or rent-free accommodation were in consistent poverty, as were almost 22% of the unemployed. Other high-risk groups were the ill or disabled (17.4%), non-Irish nationals (13.1%), children under 16 years of age (10.6%) and adults with no more than primary level education (10.1%). *See table 7*.

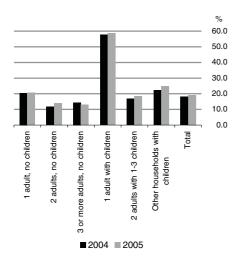

Over one third of persons in consistent poverty are children

While children under 16 years of age account for just 22.5% of the overall population they represent almost 27% of those at risk of poverty and a significantly higher 34.3% of persons in consistent poverty. In contrast, persons aged 65 and over accounted for over 11% of the population but less than 6% of those in consistent poverty. *See table 8*.

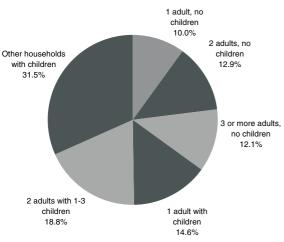

Over half of persons at risk of poverty and almost two-thirds of persons in consistent poverty lived in households with children. Members of lone parent households made up almost 15% of persons in consistent poverty, despite representing less than 4% of the population. *See table 8 & graph opposite*.

Persons living in rented or rent free accommodation made up over 43% of persons at risk of poverty and over two-thirds of persons in consistent poverty, while representing less than 22% of the overall population. Over half of persons at risk of poverty and nearly two-thirds of persons in consistent poverty lived in urban areas. See table δ .

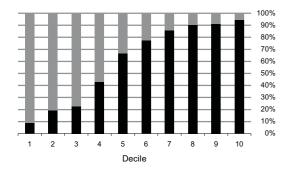

Percentage of persons that experienced deprivation classified by household composition, EU-SILC 2004 and 2005

Composition of population in consistent poverty classified by household composition, EU SILC 2005

Composition of gross household income classified by income decile, EU SILC 2005

■ Total direct income ■ Total social transfers

Social transfers account for almost 20% of gross household income

The proportion of gross household income received from social transfers increased from 18.7% in 2004 to 19.5% in 2005. Social transfers represented over 91% of gross income in the lowest decile and almost 81% of the second lowest decile in 2005. In contrast, just 5.5% of income in the top decile was generated from social transfers. *See table 13 & graph opposite.*

Households in the lower deciles tended to be composed of persons not economically active, while persons at work were more prevalent in the upper deciles. Almost 80% of persons living in households in the lowest decile were either not economically active or unemployed, compared with just 17% in the top decile and just over one-third overall. *See table 13*.

Top income group had almost five times more income than the bottom

In 2005 the income quintile share ratio shows that persons in the top income quintile had almost 5 times the equivalised income of those in the bottom income quintile, indicating no significant change over the past 3 years. Another measure of inequality, the Gini coefficient, increased slightly over the period from 31.1% in 2003 and 31.8% in 2004 to 32.4% in 2005. There was also a slight increase in the 'relative at risk of poverty gap' between 2004 and 2005 (19.8% in 2004 compared with 20.8% in 2005). *See table 1*.

Just under 22% of average gross income in the lowest equivalised income decile and less than 30% in the second lowest decile was generated from direct income. The average net disposable equivalised income in the lowest income decile was almost \in 127, while it increased to almost \in 180 in the second decile. This compared with an average income of just over \in 960 in the top decile and approximately \in 380 overall. *See table 14a*.

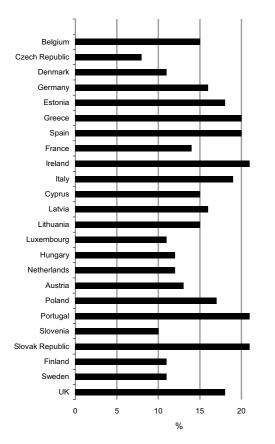

Over half the elderly had incomes close to the poverty threshold

Over half of all persons aged 65 and over were in the second and third deciles, indicating that their income, mainly from pensions and survivors' benefits, was close to the poverty threshold. A further 7.5% were in the bottom decile with the result that close to 60% were in the bottom three deciles compared with 30% for the population overall. *See table 14c*.

Almost 60% of members of lone parent households were also in the bottom three deciles but their income situation was more severe in that the majority, representing almost a third of all persons in such households, were in the bottom decile. In contrast, just under 6% of persons living in households with '2 adults with 1-3 children' were in the lowest income decile and just over 20% were in the bottom three deciles. *See table 14c.*

Just over 12% of the lowest equivalised income decile were members of lone parent households, compared with 3.8% in the State. A high proportion of persons in the lowest income decile were living in 'other households with children' (29.8%) or households with '3 or more adults, no children' (18.5%). The second income decile contained a greater proportion of members of '1 adult, no children' households (20.5%) which was linked to the high occurrence of elderly also in this decile. Just over 27% of persons in the second decile were aged 65 or over, compared with 11.2% of the overall population. Persons in the two lowest deciles, accounting for 20% of the population, approximate quite closely those at risk of poverty at the 60% level. *See table 14b*.

EU25 at-risk-of-poverty rate (60% threshold) including all social transfers, 2004¹

¹ Data for Malta is currently not available

Almost a quarter of persons with a chronic illness at risk of poverty

In 2005, almost one in four of those with a chronic illness or disability were at risk of poverty, representing a decrease from the 2004 figure of just over 30%. Those with a chronic illness had a significantly higher risk of poverty than those without a chronic illness (15.3%), and they were almost twice as likely to be in consistent poverty (9.5% compared with 4.8%). *See table 11*.

It is estimated from the survey that in 2005 almost 32% of the population were covered by a medical card. The average equivalised income among those covered was almost \in 12,000 per annum, compared to over \in 23,000 for those without a medical card. Almost 41% of persons with a medical card were at risk of poverty compared with just over 44% in 2004. There was virtually no change in consistent poverty for those with a medical card between 2004 (18.1%) and 2005 (18.2%). See table 11.

An estimated 48% of the population surveyed were covered by private medical insurance in 2005. The average equivalised income for this group was $\in 25,549$ per annum, compared with $\in 14,523$ for those without cover. The at risk of poverty rate for those without private health insurance was much higher than for those with insurance (28.8% compared with 7.1%). They also had a substantially higher consistent poverty rate (12.6% compared with 0.7%). Almost 25% of the population were not covered by either private medical insurance or a medical card. These persons had a lower than average at risk of poverty rate (12.1%) and consistent poverty rate (3.6%), while their average equivalised income was $\in 18,119$. See table 11.

Smokers at higher risk of poverty

The survey estimated that almost one in four of the population aged 16 and over smoked in 2005. Smokers had an average equivalised income of $\in 17,937$, almost $\in 3,000$ less than their non-smoking counterparts. The at risk of poverty rate for smokers was 21.4%, compared to 16.1% for non-smokers, and they were over 2.5 times more likely to be in consistent poverty than non-smokers (10.9% compared to 4.2%). Smoking was most common among members of lone parent households (53.9%), the unemployed (48.6%) and the ill or disabled (37.6%). See tables 11 & 12.

Irish at risk of poverty rate one of the highest in the EU

Using the internationally comparable EU definition of income, the at risk of poverty rate in Ireland in 2005 was 19.7% compared with 20.9% in 2004. The latter was one of the highest rates in the EU, matched only by Portugal and the Slovak Republic and was significantly higher than the EU-25 at risk of poverty rate of 16%. When all social transfers were excluded, the at risk of poverty rate in Ireland was 39% in 2004, the 7th lowest of the 25 EU countries. However, the inclusion of social transfers only reduced the Irish risk by 18 percentage points, compared with an average 25 percentage points across the EU as a whole. *See tables 2, 10, graph opposite and background notes*.

Background Notes

Purpose of survey

The EU Survey on Income and Living Conditions (EU-SILC) is a voluntary (for potential respondents) survey of private households. It is carried out under EU legislation (Council Regulation No 1177/2003) and commenced in Ireland in June 2003. The primary focus of the survey is the collection of information on the income and living conditions of different types of households. The survey also provides information on poverty, deprivation and social exclusion. This report presents the third set of results from the survey and is based on data collected in the period December 2004 to December 2005.

Reference period

Information is collected continuously throughout the year, with up to 130 households surveyed each week to give a total sample of 5,000 to 6,000 households in each year. In 2005, the achieved sample size was 6,085 households and 15,539 individuals. The income reference period for EU-SILC is the 12 months prior to date of interview.

Data collection

Information is collected on laptop computers, using Computer-Assisted Personal Interview (CAPI) software.

Sample design

A two-stage sample design was used. This comprised of a first stage sample of 2600 blocks (or small areas) selected at county level to proportionately represent eight strata reflecting population density. Each block was selected to contain, on average, 75 dwellings.

The eight population density stratum groups used were as follows:

- 1 Cities
- 2 Suburbs of Cities
- 3 Mixed urban/rural areas bordering on the suburbs of Cities
- 4 Towns and their environs with populations of 5,000 or over (large urban)
- 5 Mixed urban/rural areas bordering on the environs of larger towns
- 6 Towns and their environs with a population of 1,000 to 5,000 (other urban)
- 7 Mixed urban/rural areas
- 8 Rural areas

The second stage of sampling involved the random selection of sample and substitute households for each block. In cases where interviewers could not secure an interview from the sample household, they systematically approached up to three substitute households (in the same block as the sample household), in order to secure an EU-SILC interview. In this manner variations in response by region were controlled.

Weighting

The first step in the weighting procedure is the calculation of the household design weights. This is the inverse proportion to the probability with which the household was sampled. In terms of EU-SILC, the probability of the selection of a household is based on two elements, the probability of the selection of a block and the probability of selection of a household within that block. The design weights were calculated separately for cross-sectional and longitudinal households.

For cross-sectional or wave 1 households, the design weights were calculated as above and adjusted so as to be proportional to the 2005 sample as a whole. No adjustment was made for non-response as substitutions were made for non-responding households.

For longitudinal or wave 2 households, base weights were calculated by firstly adjusting the personal weights from 2004 for non-response. The Weight Share Method was then applied to calculate a base weight for the household. These design weights were then adjusted so as to be proportional to the 2005 sample as a whole.

In accordance with Eurostat recommendation, CALMAR is used to calculate the household cross-sectional weights. Benchmark information is used to gross up the data to population estimates. The benchmark estimates are based on:

- Age by sex: Individual population estimates are generated from population projections from census data. Age is broken down into three categories: 0-14, 15-34, 35-64 and 65+.
- Region: Household population estimates in each of the eight NUTS3 regions are generated using LFS data.

 Household composition: Household composition estimates are also generated from the LFS. The following categories are used:

One adult, no children

Two adults, no children

Three or more adults, no children

One adult, one or more children

Two adults, one to three children

Other households with children

Due to the "integrative" calibration method, the personal weight generated in CALMAR is equal to the household weight. Because there is no individual non-response within a household, the weights for personal cross-sectional respondents aged 16 and over is the same as the overall personal weight.

Definitions of Income

There are two definitions of income (EU and national definition) referred to in this release, the components of which are outlined below. Some key differences between EU and national definitions are:

- The EU definition of gross income does not include income from 'private pensions'. These are defined as private schemes fully organised by the individual, where contributions are at the discretion of the contributor independently of their employers or the state. Thus, 'private pensions' does not include occupational or state pensions.
- All contributions to pension plans, except for those to private pension plans as defined above, are
 deducted from gross income when calculating disposable income under the EU definition. No
 pension contributions of any kind are deducted from gross income in the calculation of
 disposable income for national purposes.
- Employer's social insurance contributions are included in the national definition of income. They are deducted from gross income in the calculation of net income. They are not included in any EU calculations of income. Employer's social insurance contributions include contributions to private health insurance and life assurance schemes.
- The EU definition of income does not include the value of goods produced for own consumption.

Gross income: Income details are collected at both a household and individual level in EU-SILC. In analysis, each individual's income is summed up to household level and in turn added to household level income components to calculate *gross household income*. The components of gross household income are:

Direct Income:

• Employee income

Gross employee cash or near cash income

Gross non-cash employee income

- Employer's social insurance contributions (not included in EU definition)
- Gross cash benefits or losses from self-employment
- · Other direct income

Value of goods produced for own consumption (not included in EU definition)

Pension from individual private plans (not included in EU definition)

Income from rental of property or land

Regular inter-household cash transfers received

Interests, dividends, profit from capital investments in unincorporated business

Income received by people aged under 16

Social Transfers

- Unemployment benefits
- Old-age benefits (note that this includes all occupational pensions other such social welfare payments to those aged 65 and over)
- · Family/children related allowances
- · Housing allowances
- · Other social transfers

Survivors' benefits

Sickness benefits

Disability benefits

Education-related allowances

Social exclusion not elsewhere classified

Disposable income: Tax and social insurance contributions are also summed to household level and subtracted from the gross household income to calculate the *total disposable household income*. The components of disposable household income are gross household income less:

- Employer's social insurance contributions (not included in EU definition)
- Regular inter-household cash transfer paid
- Tax on income and social insurance contributions (National definition of income does not deduct any pension contributions. EU definition deducts contributions to state and occupational pensions)

Equivalence scales: Equivalence scales are used to calculate the *equivalised household size* in a household. Although there are numerous scales, we focus on two: the modified OECD scale and the national scale. The national scale attributes a weight of 1 to the first adult, 0.66 to each subsequent adult (aged 14+ living in the household) and 0.33 to each child aged less than 14. The modified OECD scale attributes a weight of 1 to the first adult, 0.5 to each subsequent adult and 0.3 to each child aged less than 14. The weights for each household are then summed to calculate the *equivalised household size*.

Example:

A household consists of 5 people: 2 adults and 3 children. The modified OECD scale gives a weight of 1 to the first adult and 0.5 to each subsequent adult (aged 14+) living in the household, and 0.3 to each child. Thus, this household's *equivalised household size* is 1 + 0.5 + 0.3 + 0.3 + 0.3 = 2.4.

Equivalised income: The disposable household income is divided by the *equivalised household size* to calculate the equivalised income for each individual, which essentially is an approximate measure of how much of the income can be attributed to each member of the household. This *equivalised income* is then applied to each member of the household.

Example:

If a household has a total disposable income of 50,000 and the equivalised household size is 2.4, the equivalised income for this household is 20,833.33. This income is applied to each member of the household.

Laeken indicators

In 2001 the Laeken European Council endorsed the first set of 18 common statistical indicators for social inclusion, which will allow monitoring in a comparable way of member states' progress towards agreed EU objectives regarding poverty and social exclusion. They cover four dimensions of social exclusion: financial poverty, employment, health and education. The Laeken indicators are:

- At-risk-of-poverty rate by various classifications
- Inequality of income distribution: S80/S20 quintile share ratio
- At-persistent-risk-of-poverty rate by gender (60% median)
- Relative at-risk-of-poverty gap
- Regional cohesion (dispersion of regional employment rates)
- Long term unemployment rate
- · Persons living in jobless households
- Early school leavers not in education or training
- Life expectancy at birth
- · Self-defined health status by income level
- Dispersion around the at-risk-of-poverty threshold
- At-risk-of-poverty rate anchored at a moment in time
- · At-risk-of-poverty rate before social transfers by gender
- Inequality of income distribution: Gini coefficient
- At-persistent-risk-of-poverty rate by gender (50% median)
- · Long term unemployment share
- Very long term unemployment rate
- Persons with low educational attainment

Some Laeken definitions

At-risk-of-poverty rate: This is the share of persons with an equivalised income below a given percentage (usually 60%) of the national median income. It is also calculated at 40%, 50% and 70% for comparison. The rate is calculated by ranking persons by equivalised income from smallest to largest and the median or middle value is extracted. Anyone with an equivalised income of less than 60% of the median is considered *at-risk-of-poverty at a 60% level*.

Inequality of income distribution (S80/S20 quintile share ratio): This is the ratio of total equivalised income received by the 20% of persons with the highest income (top quintile) to that received by the 20% of persons with the lowest income (lowest quintile).

Relative at-risk-of-poverty gap: This is the difference between the median equivalised income of persons below the at-risk-of-poverty threshold and the at-risk-of-poverty threshold, expressed as a percentage of the at-risk-of-poverty threshold.

At-risk-of-poverty rate before social transfers: This indicator is calculated based on two alternative measures of equivalised income. The first calculates equivalised income as the total disposable household income including old-age and survivors' benefits but excluding all other social transfers. The second excludes all social transfers. Any person with an equivalised income before social transfers of less than 60% of the median **after** social transfers is considered at risk of poverty before social transfers (i.e. the same threshold is used for calculating the rate before and after social transfers).

Gini coefficient: This is the relationship between cumulative shares of the population arranged according to the level of income and the cumulative share of total income received by them. If there was perfect equality (i.e. each person receives the same income) the Gini coefficient would be 0%. A Gini coefficient of 100% would indicate there was total inequality and the entire national income was in the hands of one person.

National Anti-Poverty Strategy (NAPS) indicators

At a national level, data from the EU-SILC is be used to monitor and evaluate progress towards achieving the targets set out in the National Anti-Poverty Strategy (NAPS). The NAPS was initiated by the Government after the 1995 United Nations Social Summit in Copenhagen, Denmark. The strategy, launched in 1997, sets out the extent of poverty, identifies the main themes, and formulates strategic responses to combat poverty in Ireland. The strategic aims of the NAPS fall into five key areas:

- · Educational Disadvantage
- Unemployment
- Income adequacy
- Disadvantaged Urban Areas
- · Rural Poverty

The key NAPS indicator derived from EU-SILC is the consistent poverty measure, which combines relative income measures with a lack of what are considered to be basic resources.

Consistent poverty

The consistent poverty measure looks at those persons who are defined as being at risk of poverty and assesses the extent to which this group may be excluded and marginalised from participating in activities which are considered the norm for other people in society. The identification of the marginalised or deprived is achieved on the basis of a set of eight basic deprivation indicators:

- No substantial meal for at least one day in the past two weeks due to lack of money
- Without heating at some stage in the past year due to lack of money
- Experienced debt problems arising from ordinary living expenses
- Unable to afford two pairs of strong shoes
- Unable to afford a roast once a week
- Unable to afford a meal with meat, chicken or fish (or vegetarian equivalent) every second day
- Unable to afford new (not second-hand) clothes
- Unable to afford a warm waterproof coat

An individual is defined as being in 'consistent poverty' if they are:

- · Identified as being at risk of poverty and
- Living in a household deprived of one or more of the eight basic deprivation items listed above (Note that it is enforced deprivation that is relevant in this context. For example, a household may not have a roast once a week. The household is classified as deprived of this basic indicator only if the reason they didn't have it was because they could not afford it).

Further information

Cross-sectional versus longitudinal households

In 2005, 2,727 (44.8%) of the households surveyed were longitudinal households. This means that they were surveyed in both 2004 and 2005.

The effect of both the timing of the questionnaire and the cross-sectional versus longitudinal component can be seen in the following table:

Poverty and deprivation rates for longitudinal and cross sectional respondents, 2004 and 2005

	2004			2005		
	Cross-sectional only (surveyed for first time in 2004)	,	Full sample	Cross-sectional only (surveyed for first time in 2005)	(surveyed in 2004	Full sample
At risk of poverty rate	20.0	18.1	19.4	20.3	16.3	18.5
Deprivation rates	18.8	17.0	18.3	20.3	17.9	19.2
Consistent poverty rate	7.2	5.7	6.8	7.9	5.8	7.0

Principal Economic Status Classification

Results are available using the Principal Economic Status (PES) classification, which is also used in the Quarter National Household Survey (QNHS) and the Census of Population. The PES classification is based on a combination of questions in which respondents aged 16 or over are asked what is their usual situation with regard to employment and their responses are categorised as follows:

- At work
- Unemployed
- · Student
- Engaged on home duties
- · Retired
- · Ill/disabled
- Other

Household composition

For the purposes of deriving household composition, a child was defined as any member of the household aged 14 or under. Households were analysed as a whole, regardless of the number of family units within the household. The categories of household composition are:

- · One adult, no children
- · Two adults, no children
- Three or more adults, no children
- · One adult, one or more children
- Two adults, one to three children
- · Other households with children

Urban/rural location

As previously stated, during sample design, the country is divided up into 8 strata based on population density. These areas are further classified into urban and rural areas as follows:

Urban

Cities

Suburbs of cities

Mixed urban/rural areas bordering on the suburbs of cities

Towns and their environs with populations of 5,000 or over (large urban)

Mixed urban/rural areas bordering on the environs of larger towns

Towns and their environs with a population of 1,000 to 5,000 (other urban)

Rural

Mixed urban/rural areas

Rural areas

Nationality

The estimates given on the basis are considered 'tentative' as the very large migration flows in recent years present a significant measurement challenge in a household survey such as EU-SILC. The main concerns, which are based on international experience, centre around the extent to which the survey captures minority communities in a proportionate and representative manner. Not withstanding these concerns, the CSO believes that the estimates presented in this publication provide a broadly accurate indication of the current situation of poverty in Ireland from a nationality perspective. The categories are as follows:

Irish nationals Non-Irish nationals

Regions

The regional classifications in this release are based on the NUTS (Nomenclature of Territorial Units) classification used by Eurostat. The NUTS3 regions correspond to the eight Regional Authorities established under the Local Government Act, 1991 (Regional Authorities) (Establishment) Order, 1993, which came into operation on 1 January 1994. The NUTS2 regions, which were proposed by Government and agreed by Eurostat in 1999, are groupings of the NUTS3 regions. The composition of the regions is set out below.

Border, Midland and Western NUTS2 Region			Southern and Eastern NUTS2 Region		
Border	Cavan Donegal Leitrim Louth Monaghan	Dublin	Dublin Dun Laoghaire-Rathdown Fingal South Dublin		
Midland	Sligo Laoighis Longford	Mid-East	Kildare Meath Wicklow		
VV / 4	Offaly Westmeath	Mid-West	Clare Limerick City Limerick County		
West	Galway City Galway County Mayo Roscommon	South-East	North Tipperary Carlow Kilkenny South Tipperary Waterford City Waterford County Wexford		
		South-West	Cork City Cork County Kerry
